AN ABERRANT BULIMINA SPECIES FROM RECENT SEDIMENTS OFF KARWAR, WEST COAST OF INDIA

NELOY KHARE
National Institute of Oceanography, Dona Paula, Goa - 403 004, India.

ABSTRACT

A case of abnormal two apertured Bulimina species was encountered in a sea bottom sample from 24 metre water depth off Karwar. This abnormality seems to be a case of regeneration/repair.

INTRODUCTION

The study was carried out for distribution analysis of the foraminifera in the sea bottom sediments, collected with the help of Pettersson grab sampler on board D.S.P.V. Nand Rachit during November to December 1989, from the inner shelf regions (Lat. 14° 50.0' and Long 73° 57.0') off Karwar, west coast of India revealed a very interesting feature in Bulimina at water depth of 24 m. The sediment was olive green in colour and clayey in nature.

Aberrant features in foraminifera have been observed quite frequently earlier, the abnormal feature of Bulimina sp. is reported in this note.

DISCUSSION

A normal species has triserial test in early stage, and may tend to reduce to uniserial in later portion; wall calcareous finely to coarsely perforate, radial in structure, aperture extending up from base of apertural face, with free border that may have elevated rim and fixed border attached to the internal folded tooth plate.

The specimen (Fig. 1 a) from the study area possess two apertures instead of a usual one in the last chamber. An additional growth of chambers just below the normal aperture at an angle of 45° (approx.) gives rise to an aberrant look with two apertures. This specimen resembles Bulimina exilis (Brady) and differs in having double apertures (Fig. 1 b).

Abnormality in foraminifera is well documented, Brady (1884) reported the occurrence of an abnormal Quinqueloculina sp. from the recent sediments of North Pacific, Hooper (1966) recorded an abnormal Miliolinella sp. from the New Foundland Grand Banks. Dhillon (1969; 1970) referred to an abnormal Astacolus reniformis (d'Orbigny) from the Holocene of Gantheaume Bay, Western Australia and to a double apertured Ammotium salsum (Cushman and Bronnimann) [= Ammobaculites salsum (Cushman and Bronnimann)] from the Muar river estuary, West Malaysia. Willems (1974) has also observed an aberrant Uvigerina specimen from lower Eocene of Belgium. Setty and Almeida (1972) reported abnor-
nal specimens of *Unigerina*, *Sphinctoperta* and *Nodosaria* from the shelf sediments of central east coast of India and Setty *et al*. (1983) recorded a double apertured *Spiroloculina* sp. off Bombay-Daman west coast of India.

From the above facts it is clear that abnormality in foraminifera is a common tendency. But what really caused them is still not very clear. Several possible explanations for abnormal double apertures have been offered. They are caused by (i) injury, de-cesse or mutation as reported in the case of abnoromal *Unigerina* from the upper Eocene, Mississipi (Ellison, 1953); (ii) pollution effect as in the case of abnormal *Buscula* sp. and *Quiqueloculina* sp. from Nantucket Bay, Massachusetts (Lidze, 1965); (iii) some ecological factors as in the case of abnormal *Astatoculus reniformis* (d’Orbigny) from the Gantheaume Bay; (iv) by injury and subsequent regeneration as observed in planktonic foraminifera under laboratory culture (Be’ and Spero, 1981). The abnormality observed in *Bulimina* sp. in the present samples doesn’t appear to have been caused by pollution or ecological factors because the other associated fauna were found unaffected and normal.

Therefore it may be concluded that the two apertured *Bulimina* sp. might have resulted from regeneration/repair by which the damaged portion of the chambers required healing (or repair) and in the process, a secondary growth of chambers took place with a second aperture.

**ACKNOWLEDGEMENT**

I am sincerely grateful to the Director, NIO for giving permission to publish this paper, to Dr. N. H. Hashimi and Sri M. C. Pathak for critically going through the manuscript. I will always be indebted to my guide Dr. R. Nigam who has created interest for the subject and who always inspired and encouraged me for research. Thanks are also due to Miss Geeta Menon for her kind help in many ways and valuable support.
